AUSTRALIAN DESIGNED

## THE ORIGINAL AND STILL THE BEST

Watersports enthusiasts the world over know that staying warm on or under the water is paramount to the enjoyment and safety of their favourite water sport or activity. Sharkskin is the best investment you can make to guarantee this.

To produce the world's best technical watersports apparel you need the world's most technically advanced materials, the highest quality design, manufacturing techniques and the benefit of research and expert user testing. All Sharkskin garments combine these qualities to deliver technical watersports apparel that performs beyond expectations.

### WHAT IS SHARKSKIN?

Sharkskin is a technical watersports apparel range that includes 100% Chillproof garments which provide warmth and wind protection, Performance garments which include compression technology to aid in muscle recovery, Rapid Dry garments which are perfect for summer or layering on top of other Sharkskin garments for extra warmth and sun protection, R-Series compression garments that use 'liquid titanium far infrared' technology to provide an extra boost in performance and recovery, and Covert garments that use concealment technology to allow you to get closer to marine life.

Sharkskin is ideally suited to active watersports such as scuba diving, snorkeling, kayaking, stand up paddleboarding (SUP), sailing, surfing, surf ski, jet ski, water ski, wakeboarding and river rafting. Sharkskin can be worn underneath wetsuits for extra warmth and protection from windchill for surfing, kite boarding, wind surfing and many other watersports. Sharkskin performance wear and R-Series compression provides advantages for training, competing and recovery in multisport, adventure sport and obstacle course racing (OCR).

### CHILLPROOF

An aquatic specific, windproof 3-layer composite material that has been developed for water sports athletes.

The comfortable 'micro fleece' layer is next to the skin and 'wicks' moisture and sweat away from the body to help keep you dry. The second middle 'technical'

layer is 100% windproof yet breathes to regulate body temperature while stopping wind chill. The third outer layer is a nylon/lycra blend for abrasion resistance and 4-way stretch. The three layers of Sharkskin when combined together provide the equivalent warmth of a 2.5 to 3mm wetsuit, but unlike a wetsuit the Chillproof material stops wind chill.

The Chillproof product range offers a selection of options including tops with and without heavy-duty zippers, shorts, long pants and full suits. Chillproof is neutrally buoyant, anti-microbial, odour and itch resistant. It is also UV resistant for sun protection and has a durable water repellent finish (DWR) to provide a protective shell that 'sheds' water.

### RAPID DRY

Rapid Dry is a lightweight, fast drying fabric in which the material is 'infused' and then 'heat set' with a water repellent treatment (WRT). This method achieves a finish that is vastly more effective at shedding water and lasts much longer than traditional fabric treatments. The Rapid Dry fabric is warmer than cotton and nylon/lycra synthetic fabrics when wet. It has an SPF50+ rating for full sun protection, is lightweight, breathable, durable and comes in a range of colours including hi-vis for safety on the water.

## PERFORMANCE WEAR

The Performance range has been created with the help of competition athletes. Chillproof material provides full protection from the elements, with flexible compression material allowing for maximum manoeuvrability during intense sports and neoprene for stretch and comfort. The different designs incorporate heavy-duty zippers to control heat retention and mesh panels for ventilation to allow for maximum performance as weather conditions change or as your heart rate climbs.

## COVERT

The patented built-in concealment technology of HECS StealthScreen is designed to improve your dive experience. The material is woven with HECS' conductive carbon fibers that trap and mask your naturally occurring electric signal output that many marine animals can detect and react to, enhancing your ability to get closer to marine life underwater.
